Neglected Perspectives on Science and Religion: Historical and Contemporary Relations

Dr. Viney, one of our college’s most beloved professors, has written a new book that looks at contradictions in the age old conflict between religion and science. Historic and modern views of this relationship will be discussed drawing on subjects such as the Galileo affair, evolution, causality, the problem of knowledge and traditionally neglected topics such as sexual and gender issues. Given the apparent dwindling public acceptance of science, this talk will be very interesting!
